

CLAIMS

What is claimed is:

- 1 1. A medical device comprising:
2 a polymeric carrier fiber component, wherein the carrier fiber is capable of
3 reversibly reacting with nitric oxide;
4 a nitric oxide predrug; and
5 a second fiber component, wherein said second fiber functions to sequester
6 said predrug from reactive species.
- 1 2. The medical device of claim 1, wherein the medical device is selected from the
2 group consisting of a vascular graft, a stent, a catheter, and a wound dressing.
- 1 3. The medical device of claim 1, wherein the polymeric carrier fiber component
2 comprises at least one secondary amine moiety.
- 1 4. The medical device of claim 3, wherein the polymeric carrier fiber component is
2 selected from the group consisting of a polyethyleneimine, a polyethyleneimine
3 grafted to a polysaccharide backbone, and a polyethyleneimine salt.
- 1 5. The medical device of claim 3, wherein the polymeric carrier fiber component
2 comprises a polyethyleneimine fiber.
- 1 6. The device of claim 3, wherein the polymeric carrier fiber component comprises an
2 electrospun nanofiber.
- 1 7. The medical device of claim 1, wherein the nitric oxide predrug component is
2 selected from the group consisting of a diazeniumdiolate, an O-alkylated
3 diazeniumdiolate, and an O-derivatized diazeniumdiolate.
- 1 8. The medical device of claim 1, wherein the nitric oxide predrug component
2 comprises a diazeniumdiolate.

- 1 9. The device of claim 1, further comprising an activator.
- 1 10. The device of claim 9, wherein the activator is a proton donor.
- 1 11. The device of claim 10, wherein the activator is a buffer selected from the group
2 consisting of phosphates, succinates, carbonates, acetates, formates, propionates,
3 butyrates, fatty acids, and amino acids.
- 1 12. The device of claim 10, wherein the activator is water.
- 1 13. The device of claim 1 further comprising a mobile phase.
- 1 14. The device of claim 13, wherein the mobile phase is capable of transporting an
2 activator such that it contacts the nitric oxide predrug component.
- 1 15. The device of claim 14, wherein the mobile phase is selected from the group
2 consisting of water, methanol, ethanol, propanols, butanols, pentanols, hexanols,
3 phenols, naphthols, polyols, acetic acid, N,N-dimethylformamide, dimethyl
4 sulfoxide, dimethylacetamide, and tetrahydrofuran, hexamethylphosphoramide.
- 1 16. The device of claim 1, wherein said second fiber is substantially hydrophobic.
- 18 17. The device of claim 1, wherein the second fiber is selected from the group consisting
2 of polyurethane, polyamide, polyethylene, polypropylene, polyesters, saturated
3 polyesters, polyethylene terephthalate, polytetrafluoroethylene, perfluoroethylene,
4 polystyrene, polyvinyl chloride, and polyvinyl pyrrolidone.
- 5 18. The device of claim 1, wherein the second fiber component imparts additional
6 strength.
- 7 19. the device of claim 18, wherein the second fiber component imparts sufficient
8 strength to permit the device to be free-standing devices without the assistance of a
9 substrate.
